Average Power Ratings for Coaxial Connectors

The following graph summarizes industry acceptable average power rating for a variety of coaxial connector types. The key characteristic that determines average power handling capabilities for mated coaxial connectors is its ability to pass high current and keep heat-rise to a moderate temperature. This heating directly relates to contact resistance. Contact resistance is a function of contact surface area. Therefore properly formed center contacts are critical. If connectors are long, then conductor length resistance may start to dominate. The average power rating decreases with frequency because the resistive losses increase with frequency.

High power failure is caused by the generation of heat at the contacting surfaces. When the contact resistance approaches surface resistance including skin effect, the ultimate power handling level will be approached. Application results are affected by heat-sinking of the connector plus the connector’s construction and use of higher-temperature materials. Another limiting factor is altitude because of the connector's increasing inability to dissipate heat as altitude increases. Power derating factors for temperature and altitude are provided on the following table.

Thus, there is not an absolute power handling figure for a connector type. Results may vary from supplier-to-supplier due to design, materials and manufacturing latitudes taken by each. Therefore published power ratings are typically conservative.

Extended Power Super SMA

Southwest Microwave’s “Extended Power Super SMA” connectors provide additional power handling capabilities above most standard SMA connectors because they operate reliably at higher temperatures (165°C) with moderate power (160W) or at higher/extended power (250W) at 125°C. The temperature rating as specified is the temperature that the connector will withstand and still meet the electrical specifications.

As a basic guideline, the Extended Power Super SMA will handle an additional 100W average power above what is represented in the following power chart for SMA. Therefore the recommended maximum power rating for Extended Power Super SMA connector is 250W CW at Ku-band (12.4–18.0 GHz), at a maximum temperature of 125°C.

**Example Calculation:**
At 120° C and 60,000 Ft:
Derate average power by .60 x .40
or average power x .24
Power Rating for Coaxial Connectors

Peak Power

Peak Power limitation is due to high voltage break down. This break down is directly dependent upon the dielectric strength of the total device. This break down typically takes place where a short air path may exist. The peak power rating is not frequency dependent.

A typical calculation example:

\[ E_\delta = \frac{d}{2} \ln \left( \frac{D}{d} \right) - E_s \]

\[ E_s = \text{dielectric strength} \]
\[ = 25,000 \text{ volts/inch in air} \]
\[ = 300,000 \text{ volts/inch in TFE Fluorocarbon (Teflon)} \]

A. Voltage Breakdown

25°C at sea level

B. Peak Power

\[ P_{pk} = \frac{(E_\delta / \sqrt{2})^2}{2Z_0} \quad \text{Perfect Load} \]
\[ P_{pk} = \frac{(E_\delta / \sqrt{2})^2}{4Z_0} \quad \text{Short or Open Circuit} \]

The above treatment covers situations for short duration pulses and is treated independently of corona initiation.
